Microsoft's Exchange Server is one of the most popular email servers that are available on the market today. You'll likely find it used in many medium to enterprise-level corporations around the world. As email has become an essential tool in today's business environment, making sure that the server is operating at maximum performance is likely a concern of network managers. Exchange Server does offer some reporting capabilities but they are limited in scope. DYS Analytics has developed a software environment that provides a wealth of information on Exchange Server's performance and their Email CONTROL! wins our Editor's Choice Award for performance and reporting capabilities.

The product ships with the necessary software to run the analytical software in addition to Microsoft's latest MSDE runtime version of SQL Server that houses

data retrieved by Email CONTROL! The latest version of the Apache Tomcat server is also included that hosts the system and provides a web browser-based interface for the display of various reports. The package runs on a computer system that has the Windows 2000, Windows Server 2003 or Windows XP operating system installed on the PC. Administrative rights should be granted to the user of this system for it to operate properly.

As many organizations use multiple Exchange Servers within the total corporate environment, Email CONTROL! is able to connect with the various instances with no increase in product cost. The single entry level license covers reporting capabilities on one to 5-thousand Exchange Server clients and additional licensing is available for increased client coverage.

There are two main features of DYS Analytics' Email CONTROL! that include InvestigateNOW! and TrackNOW! InvestigateNOW! provides key reports on such items as an Exchange Server's disk volume, network bandwidth for the email service, message sizes, message volume in addition to important items such as delivery failure rates and the utilization of mailboxes. Over one-hundred different reports are available with this feature and can even

report on who is sending the most amount of messages. These reports are far beyond the number of reports available through the server itself.

On the other hand, TrackNOW! is divided into three key areas that include Server Track, Internet Track and User Track. User Track is involved with the analytics of messages sent from user to user, delivery times and any encountered errors. Server Track provides the same type of information although it follows the delivery process from one Exchange Server to another and the Internet Track provides like information that involves traffic between an Exchange server and another SMTP server used over the internet.

The price of the DYS Analytics Email CONTROL! software starts at \$3,495 for the 5,000-client license. A trial of the product is available from the company. Visit their web site for more information and the trial product at www.dysanalytics.com/ecx
